

## Pond Mature

Use weekly for a healthy ammonia/nitrite free pond. Establishes new filter, removes sludge from older ponds. Use in new or cleaned filter or in spring time for a quick start.

Pond Mature is a liquid suspension of living filter bacteria. These bacteria are responsible for purifying the water of the waste products of fish metabolism.

If the filtration system in the pond is not working properly, there will be a nitrite level in the water and this will indicate that there is a danger of stress to the fish and even disease or death.

Adding Pond Mature regularly will help to maintain healthy populations of filter bacteria ensuring the health and safety of fish in the pond.

Use with the Pondlab range of water test kits.

### Dosage:

Add 10 ml to 40 gallons (180 litres) of water.

| Pack size | Treats |              |            |
|-----------|--------|--------------|------------|
|           | Litres | Imp. Gallons | US Gallons |
| 250 ml    | 4 546  | 1 000        | 1 200      |
| 500 ml    | 9 000  | 2 000        | 2 400      |
| 1000 ml   | 18 000 | 4 000        | 4 800      |
